PROFILE

Self-taught backend developer focused on .NET, with several years of independent software development experience building real-world web applications. My flagship project, Ukiyo Designs, is a production e-commerce platform I built to solve an actual business problem: replacing error-prone Excel spreadsheets at an apparel business I manage with a purpose-built system that handles catalog, orders, role-based access, payment processing, and automated cost calculation. Currently studying Software Development at a technical institute and looking for a first professional role where I can apply what I have built and keep growing alongside a team.

TECHNICAL SKILLS

Backend: C# · .NET 8 · ASP.NET Core MVC · Entity Framework Core · REST APIs

Database: MS SQL Server · SQL Views · Triggers · MySQL

Auth: ASP.NET Core Identity · Role-based authorization · OAuth

Practices: Repository Pattern · Unit of Work · Dependency Injection · SOLID principles · LINQ

Languages: Spanish (native) · English B2 — technical reading, professional writing

PROJECTS

Ukiyo Designs — E-commerce & Cost Calculator 2024 – 2025

ASP.NET Core MVC · .NET 8 · Entity Framework Core · MS SQL Server · Identity · Stripe · Facebook OAuth

- Built to solve a real problem: the apparel business I manage was calculating production costs in Excel spreadsheets that were error-prone and had no audit trail. I designed and shipped a full replacement system.
- Backend handles catalog management, shopping cart, orders, a favorites system, and multi-user company accounts where multiple employees can collaborate on the same order queue.
- Production cost calculator: admins enter fabrics, hardware, packaging, fixed monthly overhead, and percentage costs (payment processing, platform fees). Four SQL Views automatically calculate per-product costs and suggest wholesale and retail prices. SQL Triggers keep unit-level cost totals consistent whenever source values change.
- Role-based access with four distinct roles — Customer, Company, Employee, Admin — implemented through ASP.NET Core Identity with claims. Facebook OAuth for social login. Full register, login, and account management flows.
- Admin dashboard compares current selling prices against system-calculated cost-based prices, flags outdated prices, and allows controlled updates — giving the business clear visibility on margin health.
- Bilingual (Spanish / English) using IStringLocalizer and .resx files across controllers, views, and emails. Application secrets managed outside source control.

Code: github.com/Emmanuel-Valdez/Ukiyo **Live:** ukiyo.bsite.net

Funko Shop — Full Stack Store Nov 2023

Node.js · Express · MySQL · React · JavaScript

- Group full stack project: REST API backend with Express and MySQL, React frontend, JWT authentication, admin panel, product management, pagination, and cart.

EXPERIENCE

Ukiyo Mochilas — Store Operations & E-commerce 2020 – present · Mendoza

- Ran the full operation of an online apparel store: product catalog, inventory, order fulfillment, customer service, and logistics coordination.
- Migrated the storefront from TiendaNube to Tienda Negocio with no service interruption.

Recognized that manual cost spreadsheets were causing pricing errors and had no version history. Defined the requirements, **designed** the data model, and built UkiyoDesigns to replace them — cutting cost calculation time by roughly 70% and eliminating the error class entirely.

Private Tutor — Mathematics, Physics, English 2012 – 2021

- Tutored students individually and in small groups. Teaching assistant for technical English at university level. Developed the habit of breaking down complex problems into understandable steps.

EDUCATION & TRAINING

Tecnicatura Superior en Desarrollo de Software 2025 – present IFTS N° 29

.NET Core MVC E-commerce [.NET 8] — Bhrujen Patel, Udemy (2023)

Full Stack Web Development — Node.js · Codo a Codo (2023)

React JS — Codo a Codo (2024)

Técnico Universitario en Producción Industrial y Automatización — ITU UNCuyo (2017 – 2023)
